Using Isollat heat-insulating material at the facilities of FSUE PA Mayak of  
Rosatom State Corporation for Atomic Energy

The proposed insulation based on liquid-ceramic Isollat coating has proved in a number of sites as the most effective way to reduce heat loss at low product cost and ease of application.

It is important that Isollat material can be applied without stopping the processes.

Using this material allows isolating not only pipelines, but also equipment with more complex configuration (valves, flanges, etc.).
