

JSC Bayan Sulu, Republic of Kazakhstan

COMMENT

In 2008, our company provided heat insulation of the cooling system in chocolate shop No. 2 (cold water pipeline). Heat insulation was necessary, as condensation appeared on the pipe surface.

We used new material: Isollat liquid ceramic coating. The thickness of coating was 1.5 mm.

We followed the process for using Isollat materials, and achieved a positive result: condensation on the pipe surface was fully eliminated.

We monitored the insulated surface during one year, and did not discover any drawbacks, or any condensation.

The results of the works have proved high efficiency of using Isollat materials for pipelines insulation and eliminating condensation.

JSC Bayan Sulu recommends using this technology in such cases.
